

Experiment 1: Future Method Apex

Objective

To implement a Future Method using the `@future` annotation for executing background tasks asynchronously, allowing the user transaction to complete without delay.

Description

Future Methods enable time-consuming operations to run in the background after the current transaction has finished. This improves system performance and enhances the user experience by handling non-urgent tasks asynchronously. In this experiment, a Future Method is implemented to retrieve an Account record and print its details in the Debug Log for verification.

Apex Code :

```
public class FutureMethodExample {  
  
    @future  
  
    public static void processApplicationAsync(Id accountId) {  
  
        System.debug('Future Method Started');  
  
        Account acc = [  
  
            SELECT Id, Name  
  
            FROM Account
```

```

WHERE Id = :accountId

];

System.debug('Processing Account: ' + acc.Name);

}

}

```

Experiment 2: Execute Future Method

Objective

To execute the Future Method using Execute Anonymous and verify that the asynchronous process starts successfully.

Description

The Future Method is executed from the Developer Console using Execute Anonymous. The Account ID is passed as an input parameter, and Salesforce schedules the method for asynchronous execution.

Execute Anonymous Code :

```
FutureMethodExample.processApplicationAsync('001hg000007UBBhAAO');
```

The screenshot displays the Salesforce Developer Console interface. The top navigation bar shows the current context: 'resilient-unicorn-9fd1hw-dev-ed.trailblaze.my.salesforce.com/_ui/common/apex/debug/ApexCSIPage'. The main area is divided into two tabs: 'Execution Log' and 'Logs'.

The 'Execution Log' tab is active, showing a list of events with columns for 'Timestamp', 'Event', and 'Details'. The log shows the execution of the 'FutureMethodExample.processApplicationAsync' method, which is a future method. The log entries include 'USER_INFO', 'EXECUTION_START', 'CODE_UNIT_START', 'CODE_UNIT_FINISH', 'EXECUTION_FINISH', 'HEAP_ALLOCATE', 'METHOD_ENTRY', 'STATEMENT_EXECUTE', and 'HEAP_ALLOCATE'.

The 'Logs' tab is also visible, showing a list of logs with columns for 'User', 'Application', 'Operation', 'Time', 'Status', 'Read', and 'Size'. The logs show the execution of the 'FutureHandler' class, which is a future handler. The logs entries include 'DUDALA MADHAVI', 'Unknown', '/services/data/v67.0/tooling/executeAnonymous', '07/08/2026, 10:28:22', 'Success', 'Unread', and '2.23 KB'.

Experiment 3: Debug Log Verification

Objective

To verify that the Future Method has started successfully using the Salesforce Debug Log.

Description

The Debug Log displays the message "Future Method Started", confirming that Salesforce executed the Future Method asynchronously.

Experiment 4: Processing Account

Objective

To verify that the Future Method successfully retrieved and processed the Account record.

Description

The Debug Log displays the Account name that was processed by the Future Method, confirming successful execution.

The screenshot shows the Salesforce Developer Console interface. The top navigation bar includes tabs for 'Log in', 'Hands-On Orgs', 'Test Account | Account | Sales', 'Developer Console', and 'Ask Gemini'. The address bar shows the URL: `resilient-unicorn-9fd1hw-dev-ed.trailblaze.my.salesforce.com/_ui/common/apex/debug/ApexCSIPage`. The main area displays the 'Execution Log' for the 'Log executeAnonymous @07/08/2026, 10:28:22' session. The log shows various events such as 'HEAP_ALLOCATE', 'VARIABLE_ASSIGNMENT', 'STATEMENT_EXECUTE', 'SYSTEM_MODE', 'CUMULATIVE_LIMIT_USAGE', and 'LIMIT_USAGE'. A dialog box titled 'Log line #50 details' is open, showing the log entry: '10:28:22:050 USER_DEBUG [14] | (DEBUG) Processing Account: Test Account'. Below the log, there is a table with columns: User, Application, Operation, Time, Status, Read, and Size. The table contains three rows of log entries.

User	Application	Operation	Time	Status	Read	Size
DUDALA MADHAVI	Unknown	/services/data/v67.0/tooling/executeAnonymous	07/08/2026, 10:28:22	Success	Unread	2.23 KB
DUDALA MADHAVI	Unknown	FutureHandler	07/08/2026, 10:28:22	Success	Unread	4.06 KB
DUDALA MADHAVI	Unknown	/services/data/v67.0/tooling/executeAnonymous	07/08/2026, 10:14:49	Success	Unread	2.23 KB

Experiment 5: Queueable Apex

Objective

To create a Queueable Apex class for structured background processing.

Description

Queueable Apex allows developers to perform asynchronous processing with better control, scalability, and flexibility. The Queueable class processes Account records and prints debug messages.

Apex Code :

```
public class AccountQueueableJob implements Queueable {

    public void execute(QueueableContext context) {

        System.debug('Queueable Job Started');

        List<Account> accList = [

            SELECT Id, Name

            FROM Account

        ];

        for(Account acc : accList){

            System.debug('Processing Account: ' + acc.Name);
```

```

    }

    System.debug('Queueable Job Completed');

}

}

```

The screenshot displays the Salesforce Developer Console interface. The top section shows the code editor with the following Apex code:

```

1 public class AccountQueueableJob implements Queueable {
2
3     public void execute(QueueableContext context) {
4
5         System.debug('Queueable Job Started');
6
7         List<Account> accList = [
8             SELECT Id, Name
9             FROM Account
10        ];
11
12        for(Account acc : accList){
13            System.debug('Processing Account: ' + acc.Name);
14        }
15
16        System.debug('Queueable Job Completed');
17    }
18 }

```

The bottom section shows the Logs tab with the following data:

User	Application	Operation	Time	Status	Read	Size
DUDALA MADHAVI	Unknown	/services/data/v67.0/tooling/execute...	07/08/2026, 10:28:22	Success	Unread	2.23 KB

DUDALA MADHAVI	Unknown	/services/data/v67.0/tooling/execute...	07/08/2026, 10:14:49	Success	Unread	2.23 KB
DUDALA MADHAVI	Unknown	FutureHandler	07/08/2026, 10:14:49	List has no rows for assignment to ...		4 KB

Experiment 6: Execute Queueable Apex

Objective

To execute the Queueable Apex job asynchronously.

Execute Anonymous Code :

```
System.enqueueJob(new AccountQueueableJob());
```

The screenshot displays the Salesforce Developer Console interface. The top section shows the 'Execution Log' for the class 'AccountQueueableJob.apex', with a log entry for 'Log executeAnonymous @07/08/2026, 11:19:51'. Below this, a detailed execution log is visible, showing various events such as 'USER_INFO', 'EXECUTION_START', 'CODE_UNIT_STARTED', and 'HEAP_ALLOCATE' with their respective details.

The bottom section shows the 'Logs' tab, which contains a table of log entries. The table has columns for User, Application, Operation, Time, Status, Read, and Size.

User	Application	Operation	Time	Status	Read	Size
DUDALA MADHAVI	Unknown	/services/data/v67.0/tooling/executeAnonymous	07/08/2026, 11:19:51	Success		2.95 KB

DUDALA MADHAVI	Unknown	/services/data/v67.0/tooling/executeAnonymous	07/08/2026, 10:14:49	Success	Unread	2.23 KB
DUDALA MADHAVI	Unknown	FutureHandler	07/08/2026, 10:14:49	List has no rows for assignment to ...		4 KB

Experiment 7: Queueable Debug Messages

Objective

To verify successful execution of the Queueable Apex job using Debug Logs.

Description

The Debug Log displays:

- Queueable Job Started
- Processing Account
- Queueable Job Completed

These messages confirm successful background execution.

Experiment 8: Batch Apex

Objective

To create a Batch Apex class that processes Account records in batches.

Description

Batch Apex is used to process a large number of records efficiently by dividing them into smaller batches. The Batch class includes the start(), execute(), and finish() methods.

resilient-unicorn-9fd1hw-dev-ed.trailblaze.my.salesforce.com/_ui/common/apex/debug/ApexCSIPage

Experiment 9: Batch Execution

Objective

To execute the Batch Apex class using Execute Anonymous.

Execute Anonymous Code :

```
Database.executeBatch(new AccountBatchJob(), 5);
```

Experiment 10: Batch Debug Messages

Objective

To verify successful execution of the Batch Apex job using Debug Logs.

Description

The Debug Log displays "Batch Job Completed", confirming successful batch execution.

The screenshot shows the Salesforce Developer Console interface. The top bar includes tabs for 'Log in', 'Hands-On Orgs', 'Test Account | Account | Sales', 'Developer Console', and 'Ask Gemini'. The browser address bar shows the URL: `resilient-unicorn-9fd1hw-dev-ed.trailblaze.my.salesforce.com/_ui/common/apex/debug/ApexCSIPage`. The main window displays the 'Execution Log' for the class `AccountBatchJob.apxc`. The log shows various system events and a pop-up window for 'Log line #45 details' showing the message: `11:26:56:027 USER_DEBUG [20] [DEBUG] Batch Job Completed`.

Experiment 11: Scheduled Apex

Objective

To create a Scheduled Apex class that executes automatically at a specified time.

Description

Scheduled Apex automates background processing based on a defined schedule using the Schedulable interface.

The screenshot shows the Salesforce Developer Console interface. The top bar includes tabs for 'Log in', 'Hands-On Orgs', 'Test Account | Account | Sales', 'Developer Console', and 'Ask Gemini'. The browser address bar shows the URL: `resilient-unicorn-9fd1hw-dev-ed.trailblaze.my.salesforce.com/_ui/common/apex/debug/ApexCSIPage`. The main window displays the code for the class `AccountScheduler.apxc`. The code implements the `Schedulable` interface and includes debug statements for job start and completion. The bottom log shows the execution results.

```

1 public class AccountScheduler implements Schedulable {
2
3     public void execute(SchedulableContext sc) {
4
5         System.debug('Scheduled Job Started');
6
7         List<Account> accounts = [
8             SELECT Id, Name
9             FROM Account
10        ];
11
12        for(Account acc : accounts){
13            System.debug('Scheduled Processing: ' + acc.Name);
14        }
15
16        System.debug('Scheduled Job Completed');
17    }
18 }

```

Experiment 12: Schedule Apex Job

Objective

To schedule the Apex class using a CRON expression.

Execute Anonymous Code :

String cronExp = '0 0 12 * * ?';

System.schedule('Account Scheduler Job', cronExp, new AccountScheduler());

The screenshot shows the Salesforce Developer Console interface. The top bar includes tabs for 'Log in', 'Hands-On Orgs', 'Test Account | Account | Sales', 'Developer Console', and 'Ask Gemini'. The address bar shows the URL: `resilient-unicorn-9fd1hw-dev-ed.trailblaze.my.salesforce.com/_ui/common/apex/debug/ApexCSIPage`. The main area displays the 'Execution Log' for the 'AccountScheduler.apex' class, with a log entry for 'Log executeAnonymous @07/08/2026, 11:32:24'. The log details show various events such as 'USER_INFO', 'EXECUTION_START', 'CODE_UNIT_STARTED', 'VARIABLE_SCOPE', 'HEAP_ALLOCATE', 'STATEMENT_EXECUTE', 'METHOD_ENTRY', and 'STATEMENT_EXECUTE'. The bottom section shows the 'Logs' tab, which lists several log entries with columns for 'User', 'Application', 'Operation', 'Time', 'Status', 'Read', and 'Size'. The log entries show successful execution of the 'AccountScheduler' class.

Experiment 13: Verify Scheduled Job

Objective

To verify that the Scheduled Apex job has been successfully created.

Description

The Scheduled Jobs page displays the scheduled job name, next execution time, and job type, confirming successful scheduling.

All Scheduled Jobs

Help for this Page

The All Scheduled Jobs page lists all of the jobs scheduled by your users. Multiple job types may display on this page. You can delete scheduled jobs if you have the permission to do so.

Percentage of Scheduled Jobs Used: 1%
You have currently used 1 scheduled Apex jobs out of an allowed organization limit of 100 active or scheduled jobs. To learn about how this limit is calculated and what contributes to it see the [Lightning Platform Apex Limits](#) topic.
